

StarGPT (v2.0)

Lung Cancer Classification from Histopathological Images using Deep Transfer Learning

Youssef Negm, Omar Hossam

The Problem: Diagnosing Lung Cancer

- Leading cause of cancer deaths globally.
- Manual analysis of H&E slides: Time-consuming, prone to human error.
- Critical need for automated, rapid, accurate diagnostic support.

- Early and accurate diagnosis significantly improves patient outcomes.

The Dataset: Histopathological Images

Source: [Kaggle Lung Cancer Histopathological Images](#)

Benign

Healthy / Non-cancerous
tissue.

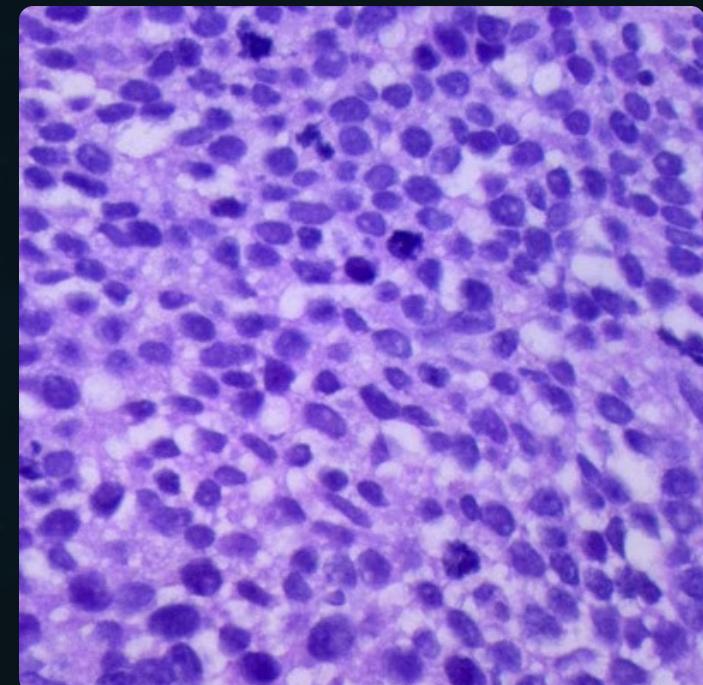

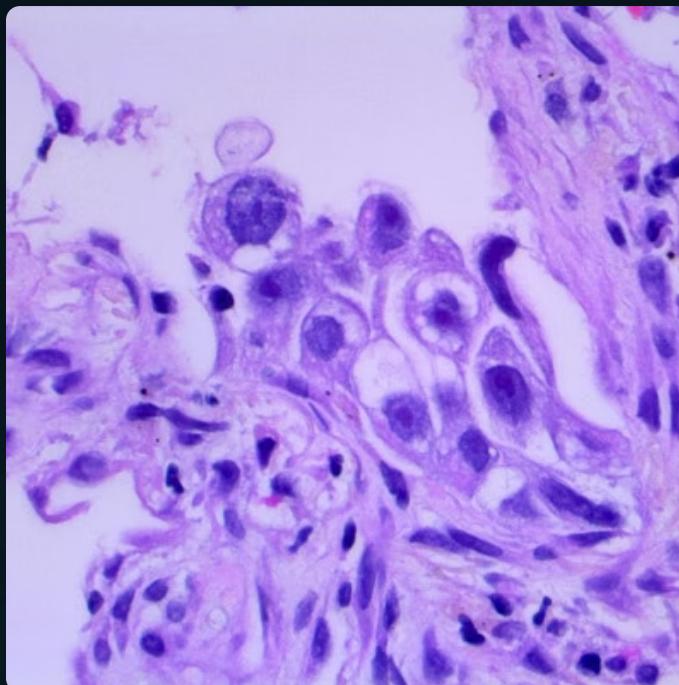

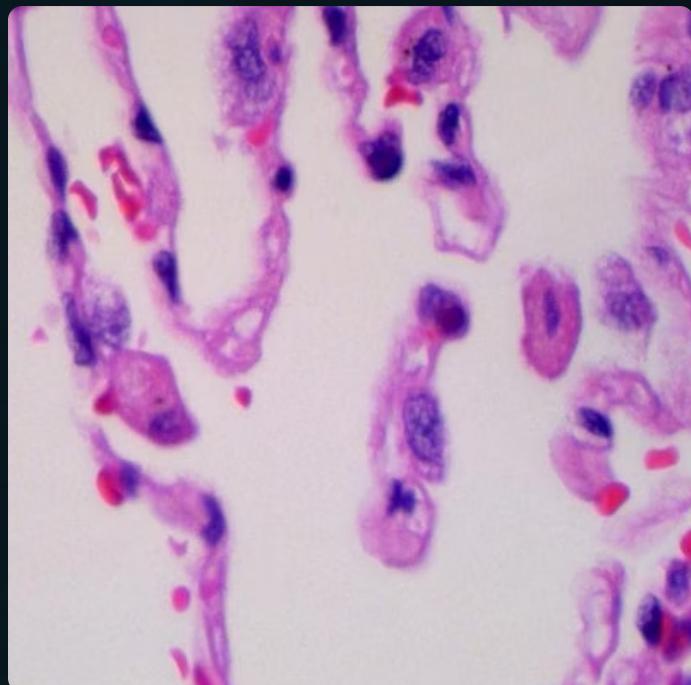

Adenocarcinoma

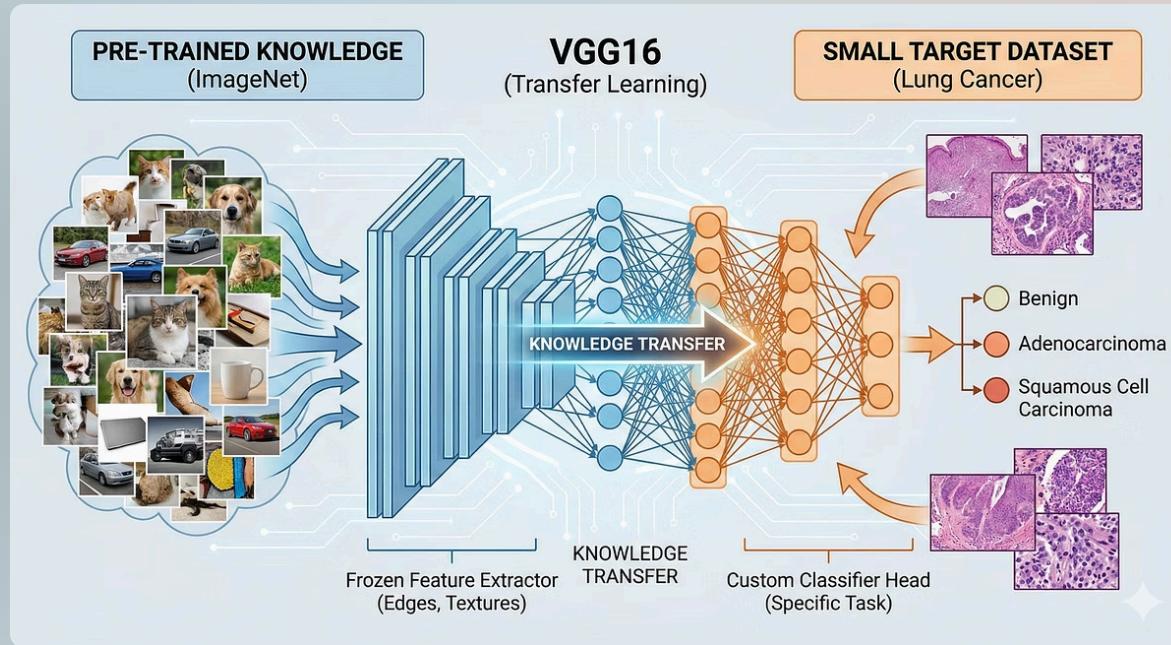

Malignant lung cancer type.

Squamous Cell
Carcinoma

Another malignant lung
cancer type.

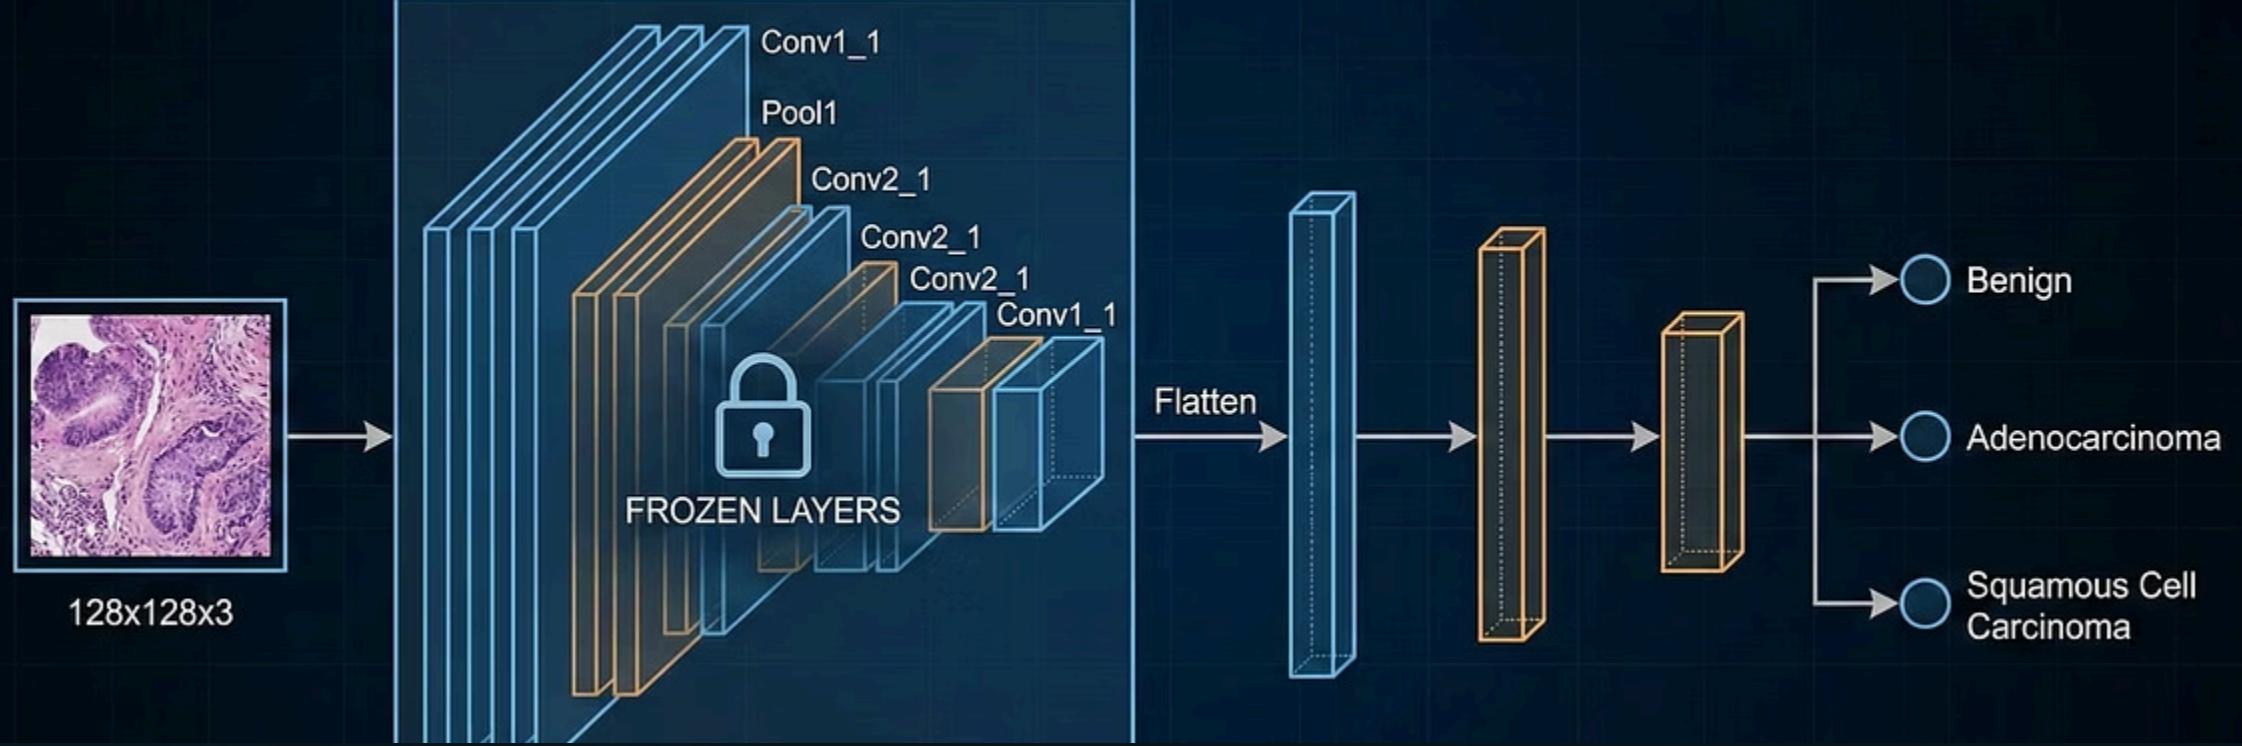

Methodology: Deep Transfer Learning

Why Transfer Learning?

- Small dataset limitations.
- Leverages pre-trained knowledge from vast datasets.
- Accelerates training, improves generalization.

Model Utilized: VGG16

- Visual Geometry Group (VGG) architecture.
- Pre-trained on ImageNet for complex feature extraction.
- Identifies edges, textures, and object parts.

VGG16 Model Architecture

- Input: 128x128 pixel RGB images.
- Base: Frozen VGG16 Convolutional Layers (Feature Extractor).
- Head (Custom Classifier):
 - Flatten Layer
 - Dense Layer (512 neurons, ReLU activation)
 - Dropout (0.5 for regularization)
 - Output Layer (3 neurons, Softmax activation)

Preprocessing & Training Strategy

Data Augmentation

Increased diversity and robustness:

- Zoom, Shear
- Width & Height Shift
- Horizontal Flip

Normalization

Standardized pixel values:

- Scaled to 1/255
- Ensures consistent input range

Optimization

Efficient model training:

- Adam Optimizer
- Categorical Crossentropy Loss

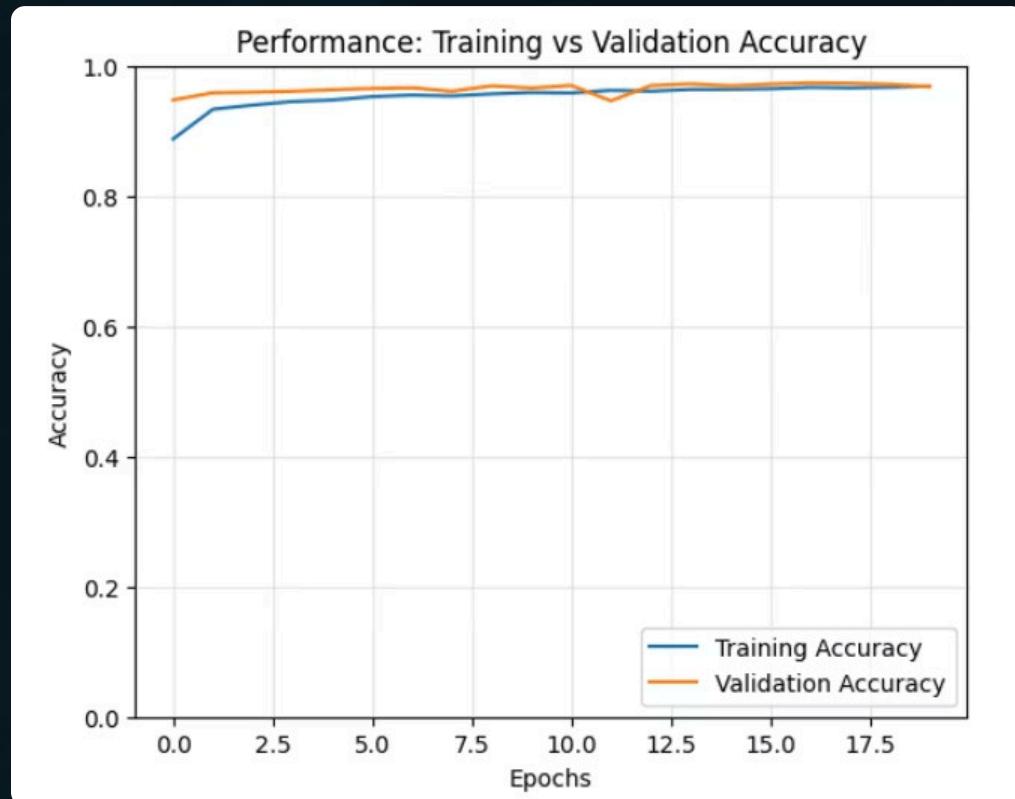

Early Stopping

Prevented overfitting:

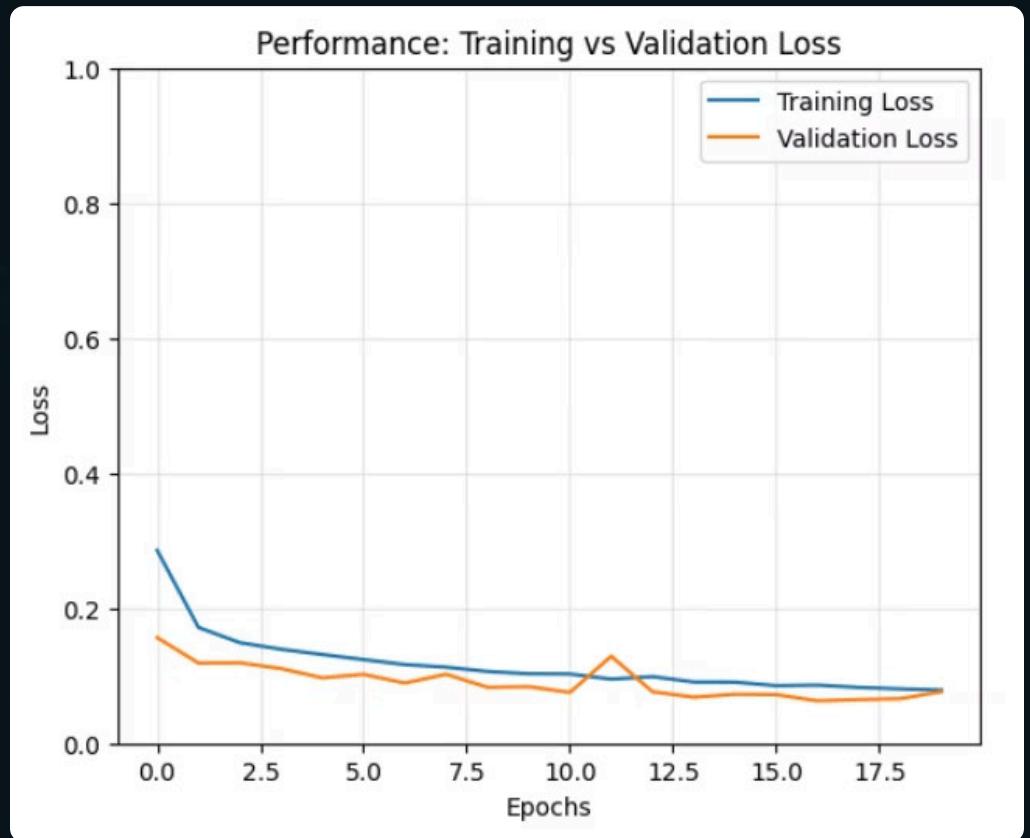

- Monitored validation loss
- Stopped training when performance plateaued

Performance Evaluation

Training vs. Validation Accuracy

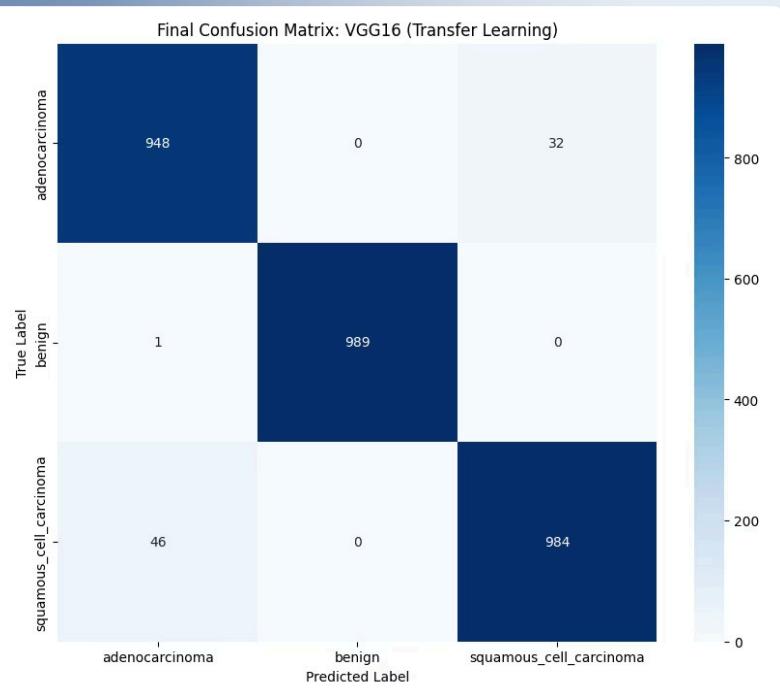

Training vs. Validation Loss

Final Testing Accuracy

```
(97.37%) --- VGG16 Classification Report ---  
precision    recall   f1-score  support  
  
adenocarcinoma      0.95     0.97     0.96    980  
benign            1.00     1.00     1.00    990  
squamous_cell_carcinoma  0.97     0.96     0.96   1030  
  
accuracy                  0.97    3000  
macro avg        0.97     0.97     0.97    3000  
weighted avg       0.97     0.97     0.97    3000
```

Confusion Matrix Analysis

- Analysis of False Positives vs. False Negatives.
- Identified classes most prone to confusion.
- Typically, malignant types (Adenocarcinoma and Squamous Cell Carcinoma) can be challenging to differentiate.

System Implementation: The Web App

Frontend

- React.js + Vite
- Tailwind CSS
- Modern, Dark Mode UI

Backend

- Flask (Python)
- Serves VGG16 model via REST API

Workflow

- User uploads image.
- API processes image.
- Real-time prediction returned.

StarLung Classifier

Upload a histopathology slide image (H&E stained) to detect Adenocarcinoma, Squamous Cell Carcinoma, or Benign tissue.

A histopathology slide image showing a dense cluster of cells with purple-stained nuclei and some yellowish cytoplasmic areas. A red 'X' button is located in the top right corner of the image area.

Analyze Sample

Built with Flask, React & TensorFlow

StarLung Classifier

Upload a histopathology slide image (H&E stained) to detect Adenocarcinoma, Squamous Cell Carcinoma, or Benign tissue.

DIAGNOSIS RESULT

Squamous Cell Carcinoma
Top Confidence: 99.92%

MODEL CONFIDENCE BREAKDOWN

Category	Confidence (%)
Adenocarcinoma	0.08%
Benign	0.00%
Squamous Cell Carcinoma	99.92%

View Raw JSON

```
[{"category": "Squamous Cell Carcinoma", "confidence": 99.92}, {"category": "Adenocarcinoma", "confidence": 0.08}, {"category": "Benign", "confidence": 0.0} ]

Conclusion & Future Work

Conclusion:

Successfully developed an end-to-end diagnostic tool for lung cancer classification with high accuracy, leveraging transfer learning and a robust web application.

Future Work:

- Integration of additional datasets for broader generalizability.
- Exploration of advanced transformer models for improved feature learning.
- Deployment of the tool in clinical settings for real-world validation.
- Development of explainable AI features to enhance trust and interpretability.
